

Portable Inductive Loop System

With the help of an induction loop system, hearing-aid users can receive signals produced by electrical/electronic audio sources, such as microphones or audio systems.

The compact, portable inductive loop system, puts people with hearing disabilities in touch with what's happening around them - by transmitting the spoken word directly to their hearing aid or to an inductive loop receiver.

The system allows the listener to move freely around a room and pick up the audio signals fed directly into their hearing aids.

Because the signals are delivered directly into hearing-aids, the listener hears the sound without any annoying background noise, echo or reverberation.

Perfect for conferences and meetings, these audio transmission systems are now available from Avcom Staging. This exciting new service combined with our existing high-end audio, lighting, video, theming and stage services, make Avcom your ***"One-Stop-Destination"*** for technical and creative event services.
